

一。安装环境

类别	名称	版本	安装路径
操作系统	Cent0S	CentOS release 6.2 (Final)	
Apache *	Apache	2. 2. 22	/usr/local/apache
Subversion	Subversion	1.7.4	/usr/local/subversion

- * 此处 apache 可以不安装, 安装 apache 为了支持 svn_dav 的方式用 http 协议访问
- * 如果不安装 apache 则只能使用 svn:// 协议来访问 svn 资源库

名称	下载链接	下载地址
Apache	httpd-2. 2. 22. tar. gz	http://httpd.apache.org/download.cgi
Subversion	subversion-1.7.4.tar.gz	http://subversion.apache.org/
Sqllite	sqlite-amalgamation-3071100.zip	http://www.sqlite.org/download.html
Neon	neon-0.29.6.tar.gz	http://www.webdav.org/neon/
APR	apr-1.4.5. tar.gz	http://apr.apache.org/download.cgi
APR-util	apr-util-1.3.12.tar.gz	http://apr.apache.org/download.cgi
apr_memcache	apr_memcache-0.7.0.tar.bz2	http://www.outoforder.cc

二. 软件安装

```
# neon
  tar zxvf neon-0.29.6.tar.gz
  cd neon-0.29.6
  ./configure
  make
  make install
# apr
  tar zxvf apr-1.4.6.tar.gz
  cd apr-1.4.6
  ./configure
```

```
make
make install
tar zxvf apr-util-1.4.1.tar.gz
cd apr-util-1.4.1
./configure --with-apr=/usr/local/apr
make
make install
tar jxvf apr_memcache-0.7.0.tar.bz2
cd apr_memcache-0.7.0
./configure --with-apr=/usr/local/apr --with-apr-util=/usr/local/apr
make
make install
tar zxvf subversion-1.7.4.tar.gz
unzip -qq sqlite-amalgamation-3071100.zip -dsubversion-1.7.4
cd subversion-1.7.4
mv sqlite-amalgamation-3071100 sqlite-amalgamation
tar zxvf httpd-2.2.22.tar.gz
cd httpd-2.2.22
./configure --prefix=/usr/local/apache --enable-proxy --enable-proxy-http --enable-
proxy-ajp --enable-rewrite --enable-so --enable-dav --enable-maintainer-mode --enable-
proxy-balancer
make
make install
cd subversion-1.7.4
./configure --prefix=/usr/local/subversion --with-apxs=/usr/local/apache/bin/apxs
--with-apr=/usr/local/apr --with-apr-util=/usr/local/apr
make
make install
```

三. 配置 Apache 加载 SVN DAV

```
vim /usr/local/apache/conf/httpd.conf

51 # Example:
52 # LoadModule foo_module modules/mod_foo.so
53 LoadModule dav_svn_module modules/mod_dav_svn.so
```

```
54 LoadModule authz_svn_module modules/mod_authz_svn.so
55 #
```

四. 配置 SVN 仓库,此处以 jsw_base 为例

1. 采用 svn:// 方式访问资源

```
mkdir -p /srv/svn.repos/
cd /srv/svn.repos/
/usr/local/subversion/bin/svnadmin create jsw_base
vim /srv/svn.repos/jsw_base/conf/authz
[groups]
   test = hua.wang,ping.bao
[jsw_base:/]
  @test = r
   ping.bao = rw
[jsw_base:/test_dir]
vim /srv/svn.repos/jsw_doc/conf/passwd
hua.wang = 123456
ping.bao = 654321
vim /srv/svn.repos/jsw_doc/conf/svnserve.conf
[general]
anon-access = none
auth-access = write
password-db = passwd
authz-db = authz
```

2. 采用 http 的 SVN-dav 方式访问资源

```
# 创建 SVN 资源仓库

mkdir -p /srv/svn.repos/
cd /srv/svn.repos/
/usr/local/subversion/bin/svnadmin create jsw_base

# 以下配置供集成 apache 以 svn_dav 方式访问备用
```

```
vim /srv/etc/repos.authz
[groups]
   test = hua.wang,ping.bao
[jsw_base:/]
   @test = r
   ping.bao = rw
[jsw_base:/test_dir]
   * =
htpasswd -n -b ping.bao 123456
vim /srv/etc/repos.httpd.passwd
hua.wang:F0BbdGnavhEA6
ping.bao:F0.XfuWy6GOqo
<Location /svn>
  DAV svn
   SVNParentPath /srv/svn.repos
   AuthzSVNAccessFile /srv/etc/repos.authz
   Require valid-use
   AuthType Basic
   AuthName "SVN Repository"
   AuthUserFile /srv/etc/repos.httpd.passwd
</Location>
```

五. 启动 SVN 服务器

使用 http://	/usr/local/apache/bin/httpd -k start	
	/usr/local/apache/bin/httpd -k graceful	
使用 svn://	/usr/local/subversion/bin/svnserve -r /srv/svn.repos -d	

^{*} undefined symbol: apr_memcache_add_server 为 APR 版本兼容性问题
